

Causal Inference with Treatment Measurement Error

A Non-parametric Instrumental Variable Approach

Z., Limor Gultchin, Arthur Gretton, Matt Kusner, Ricardo Silva

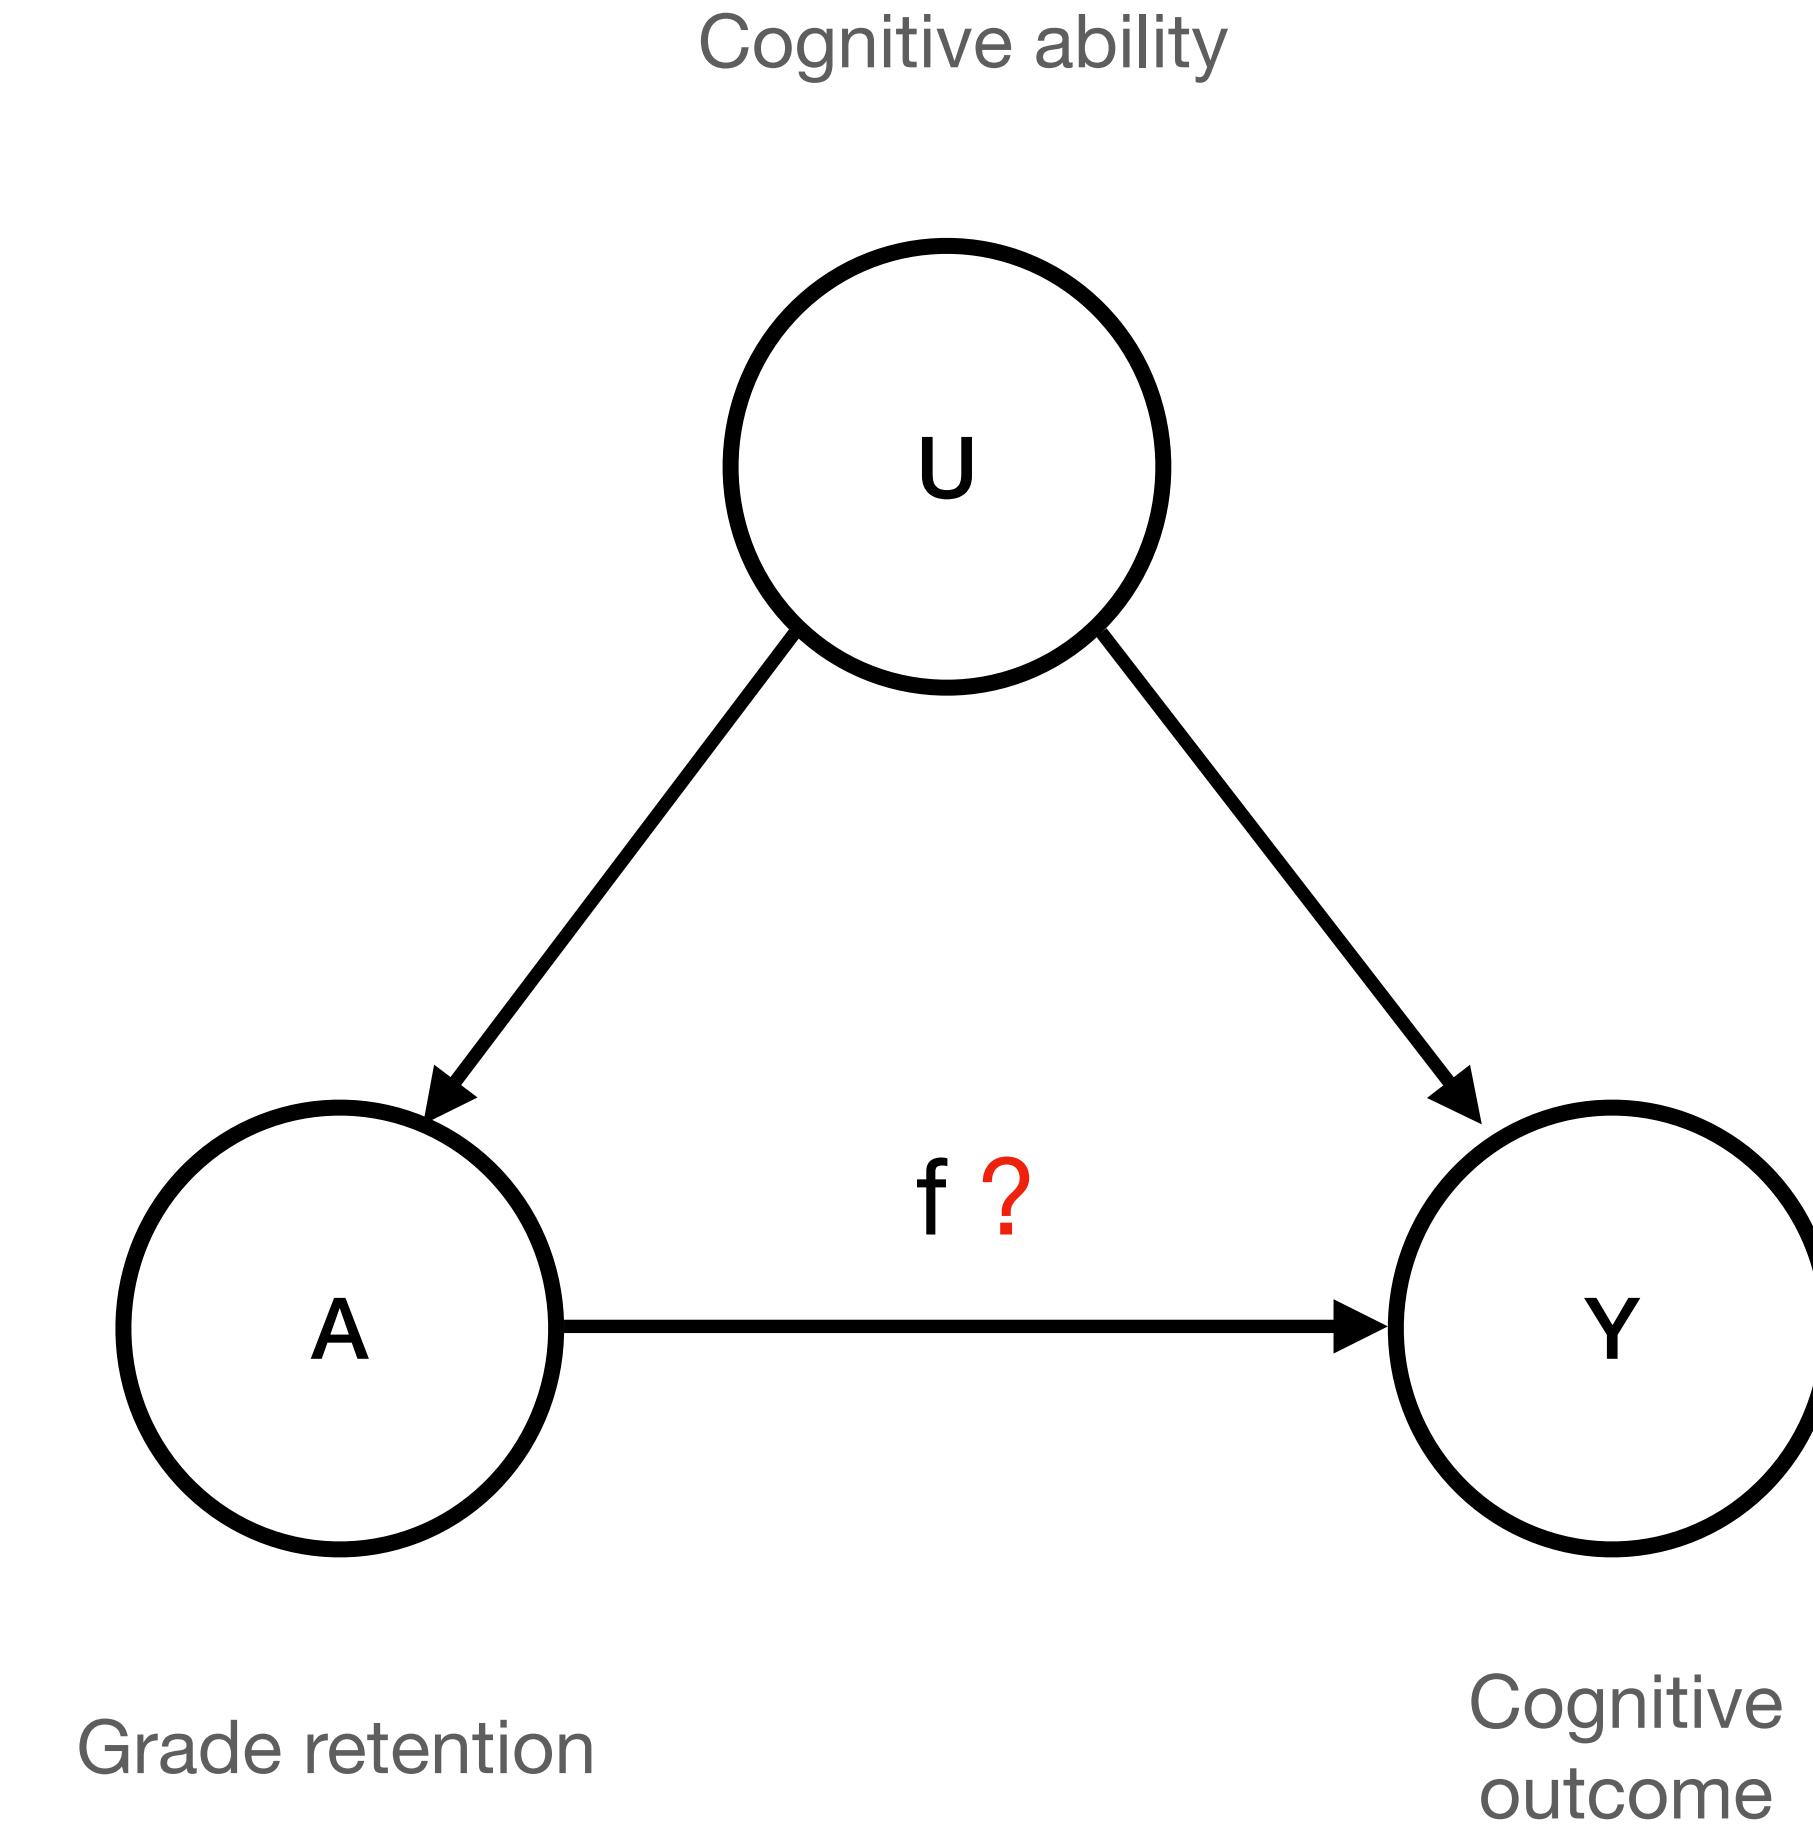

Gatsby talk 07.2022

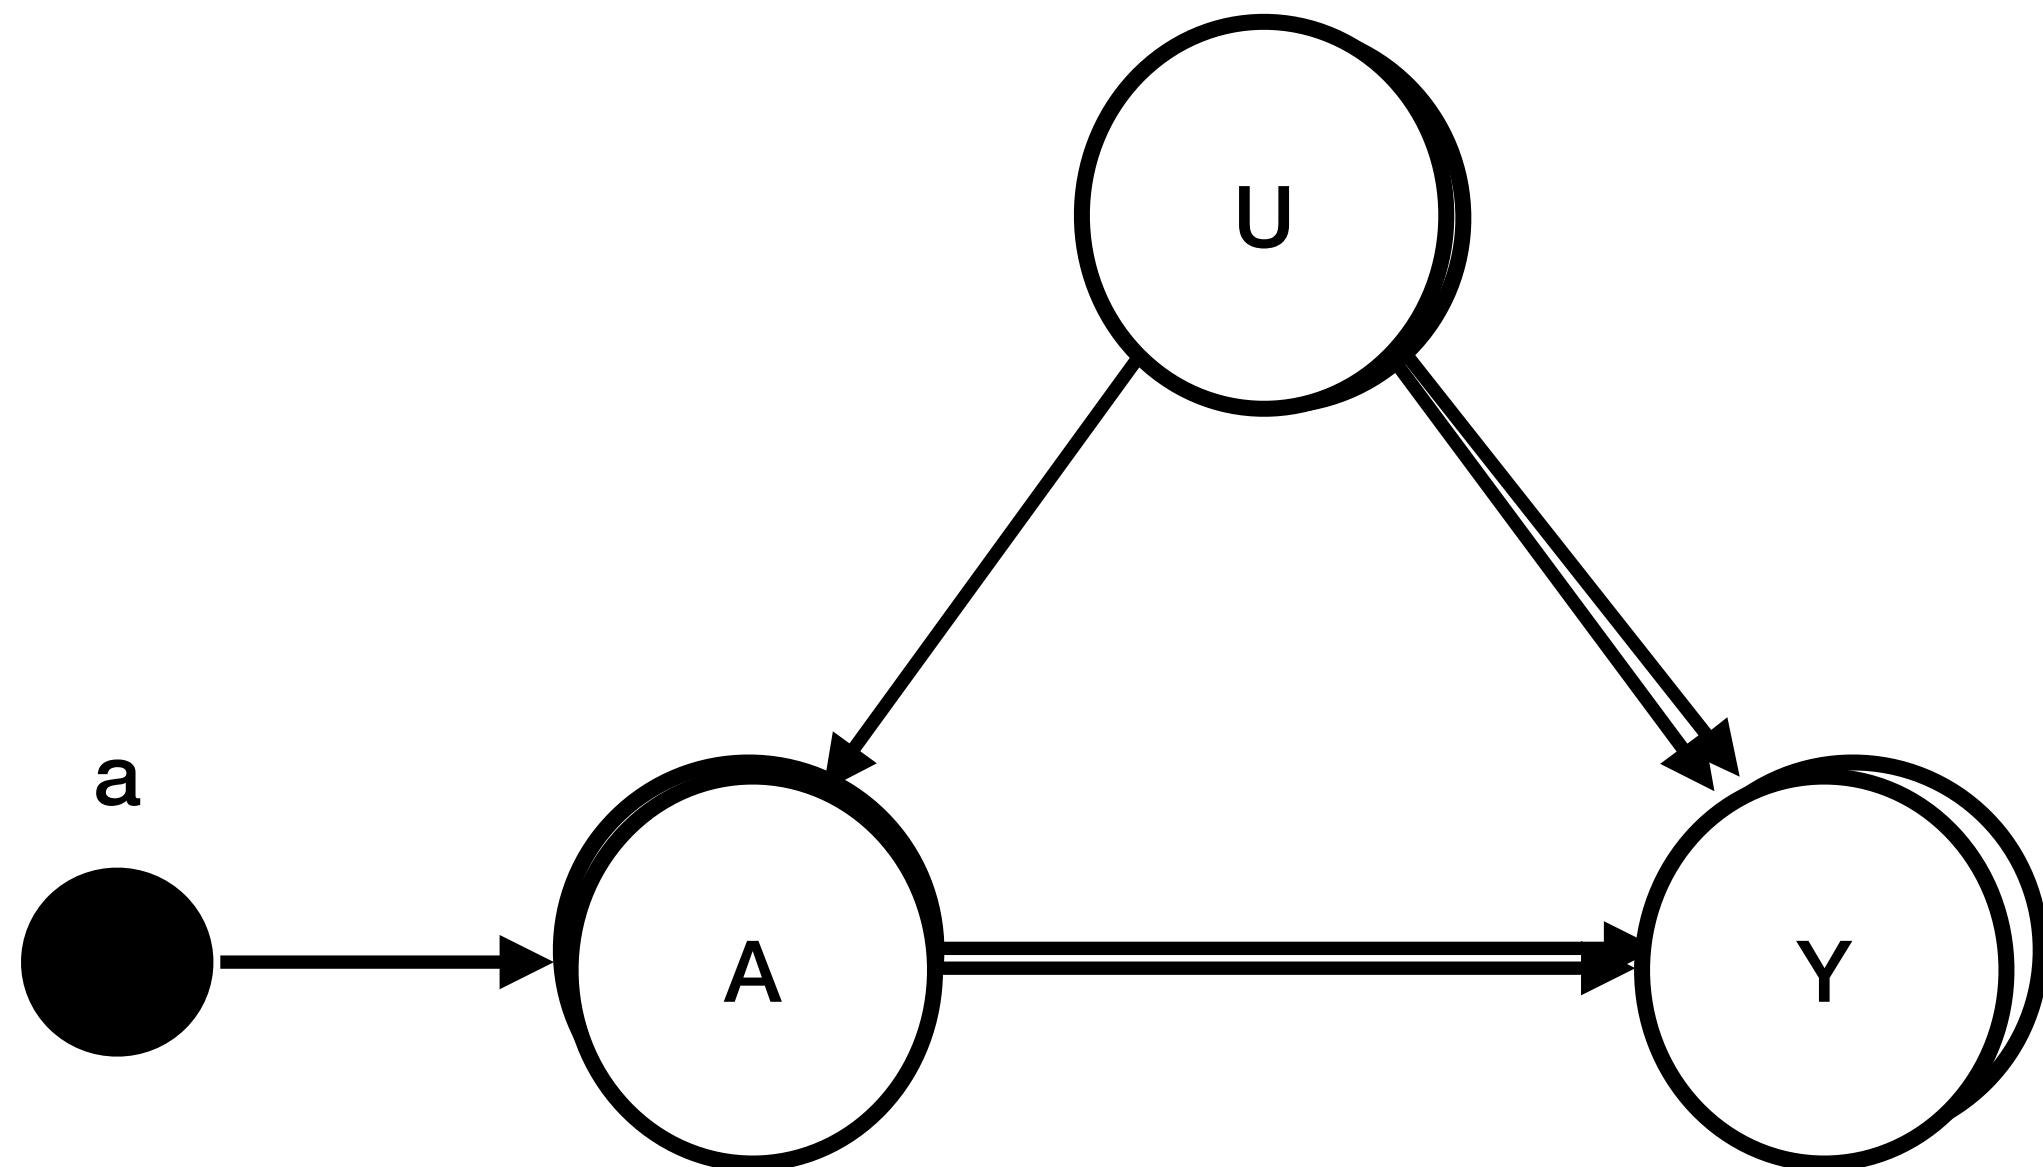

Why causal inference? An example.

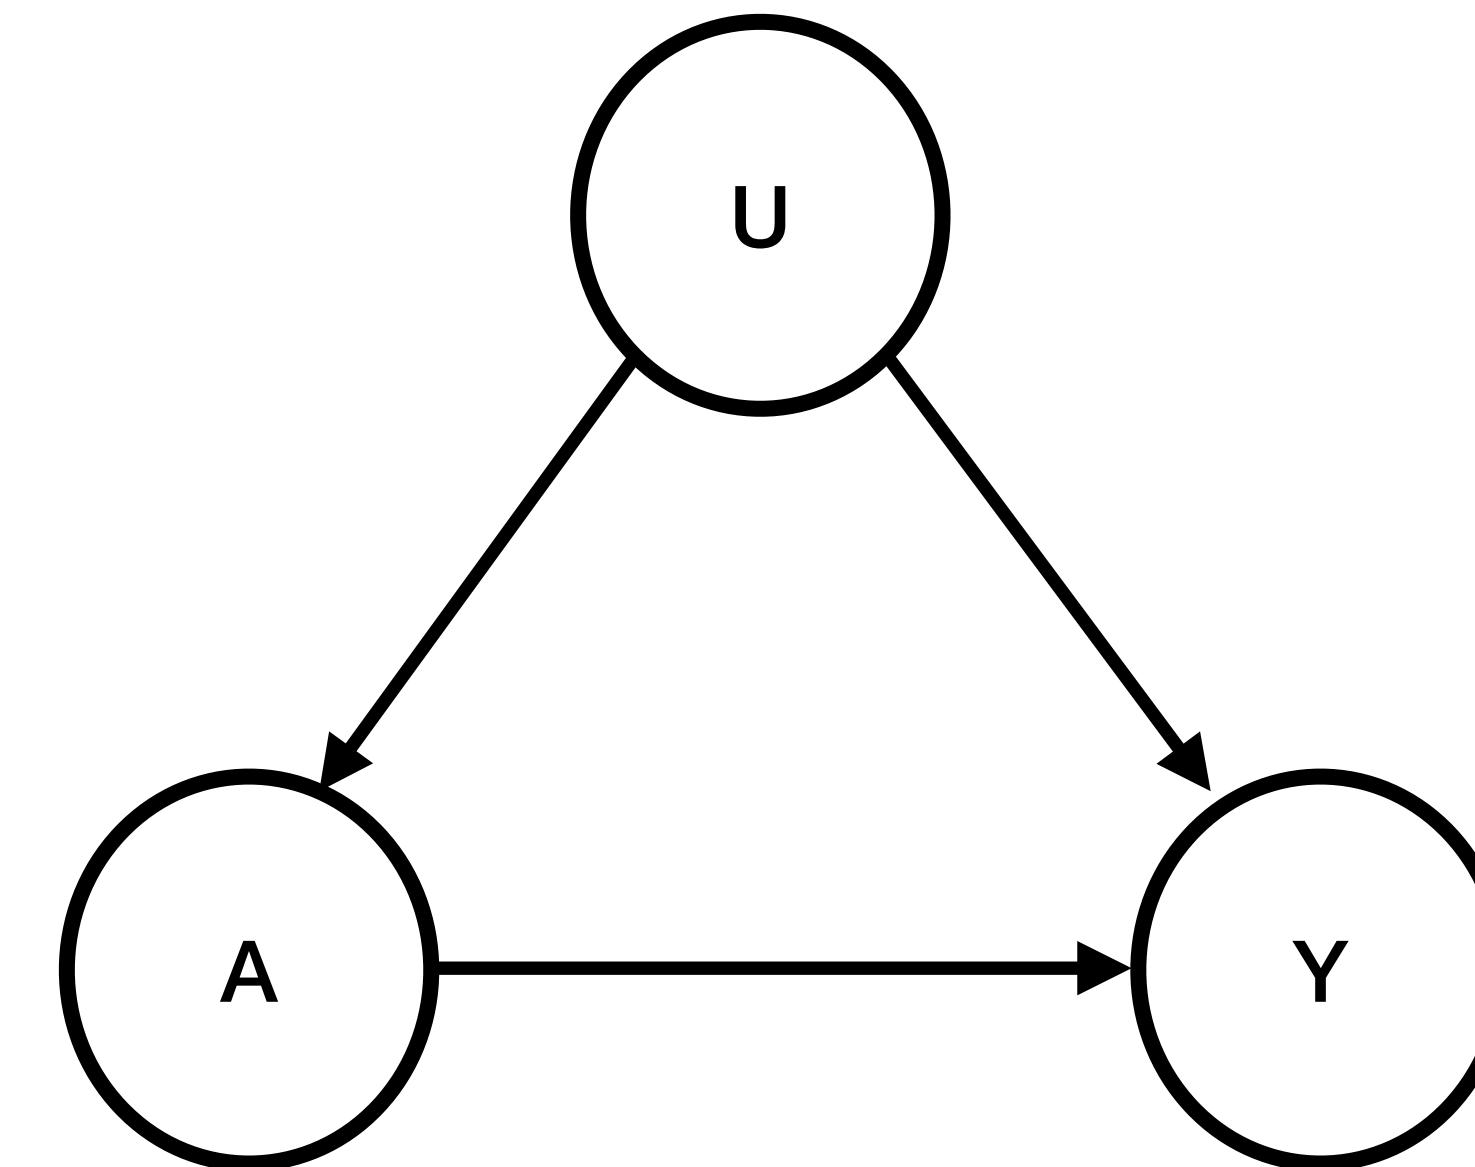

Image source: Google image

The target quantity

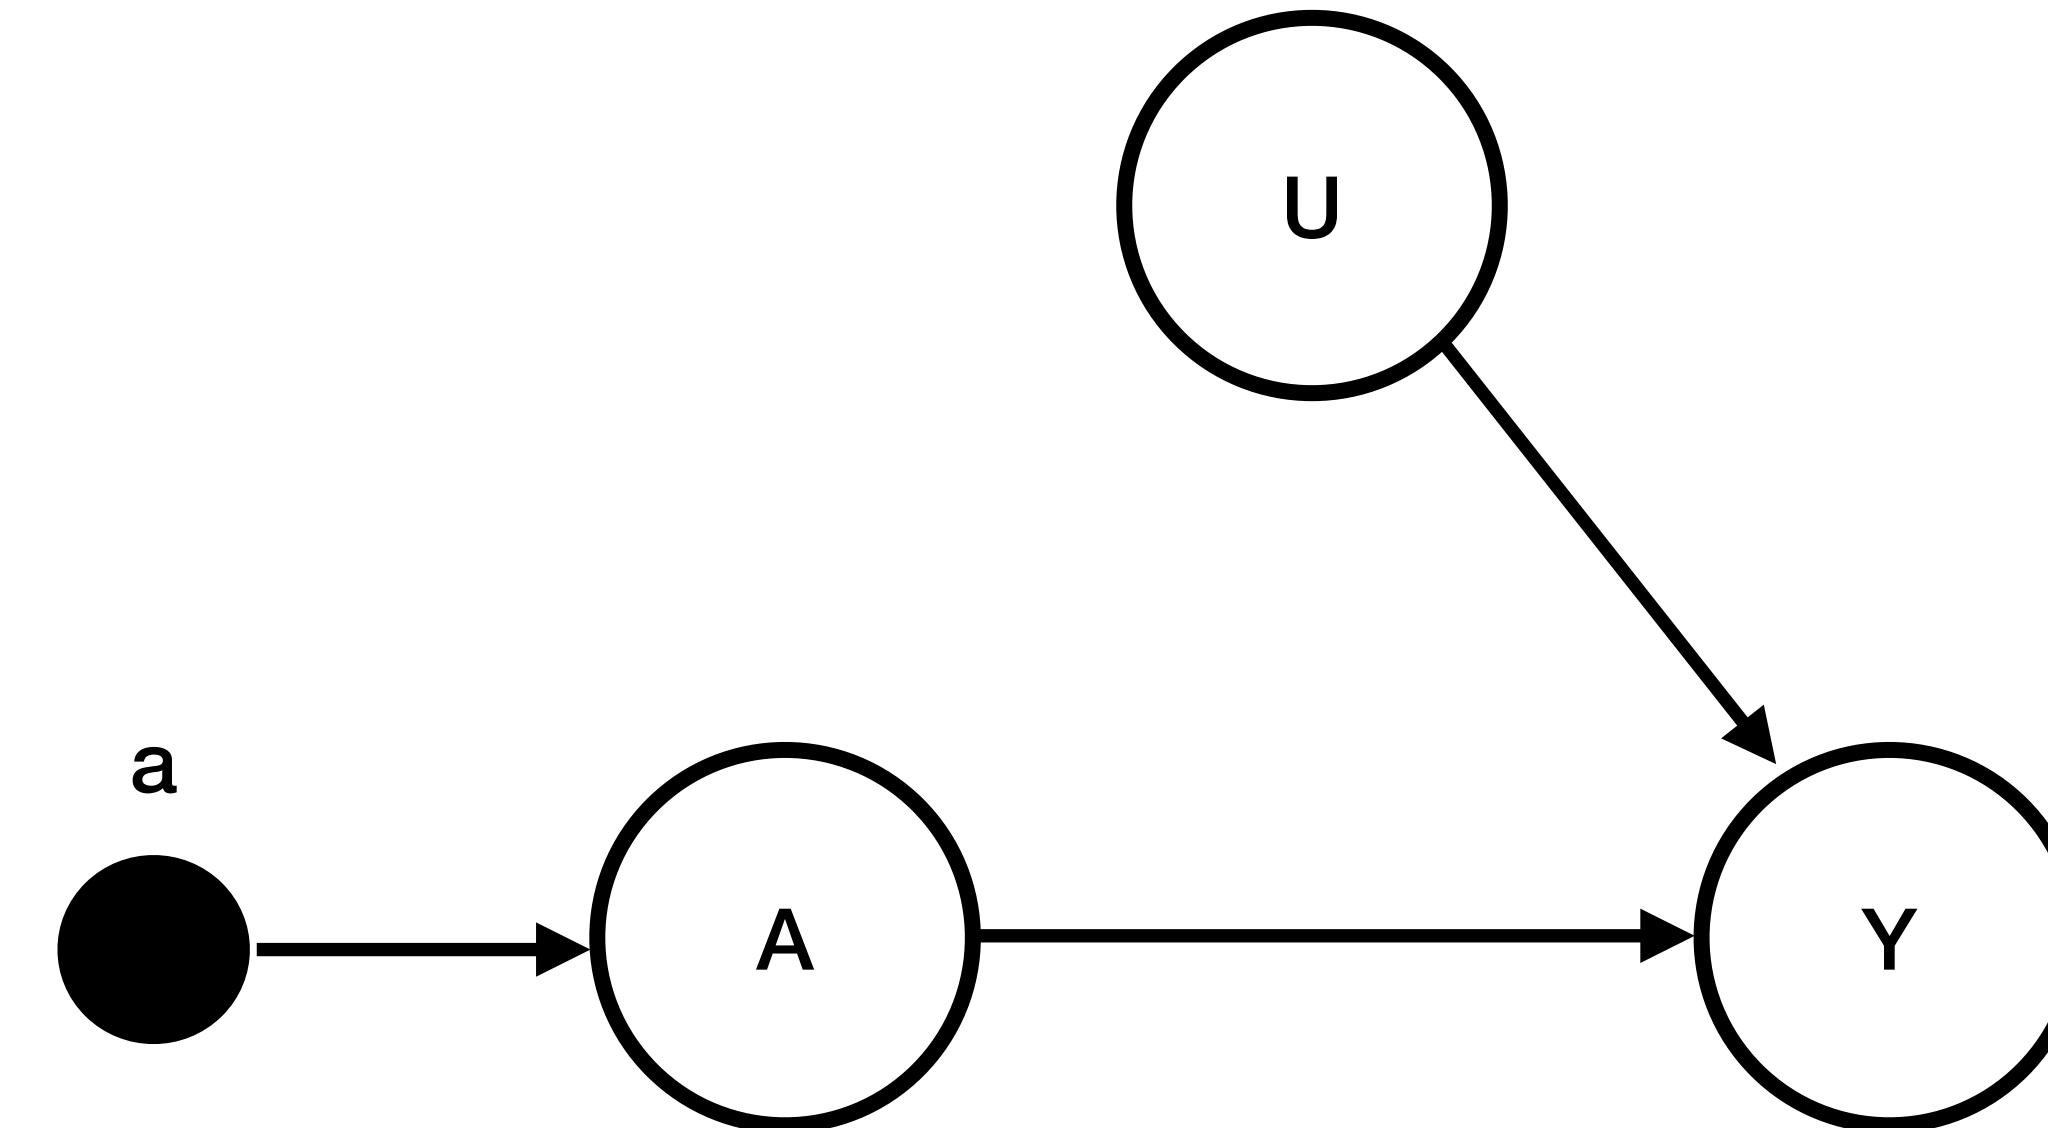

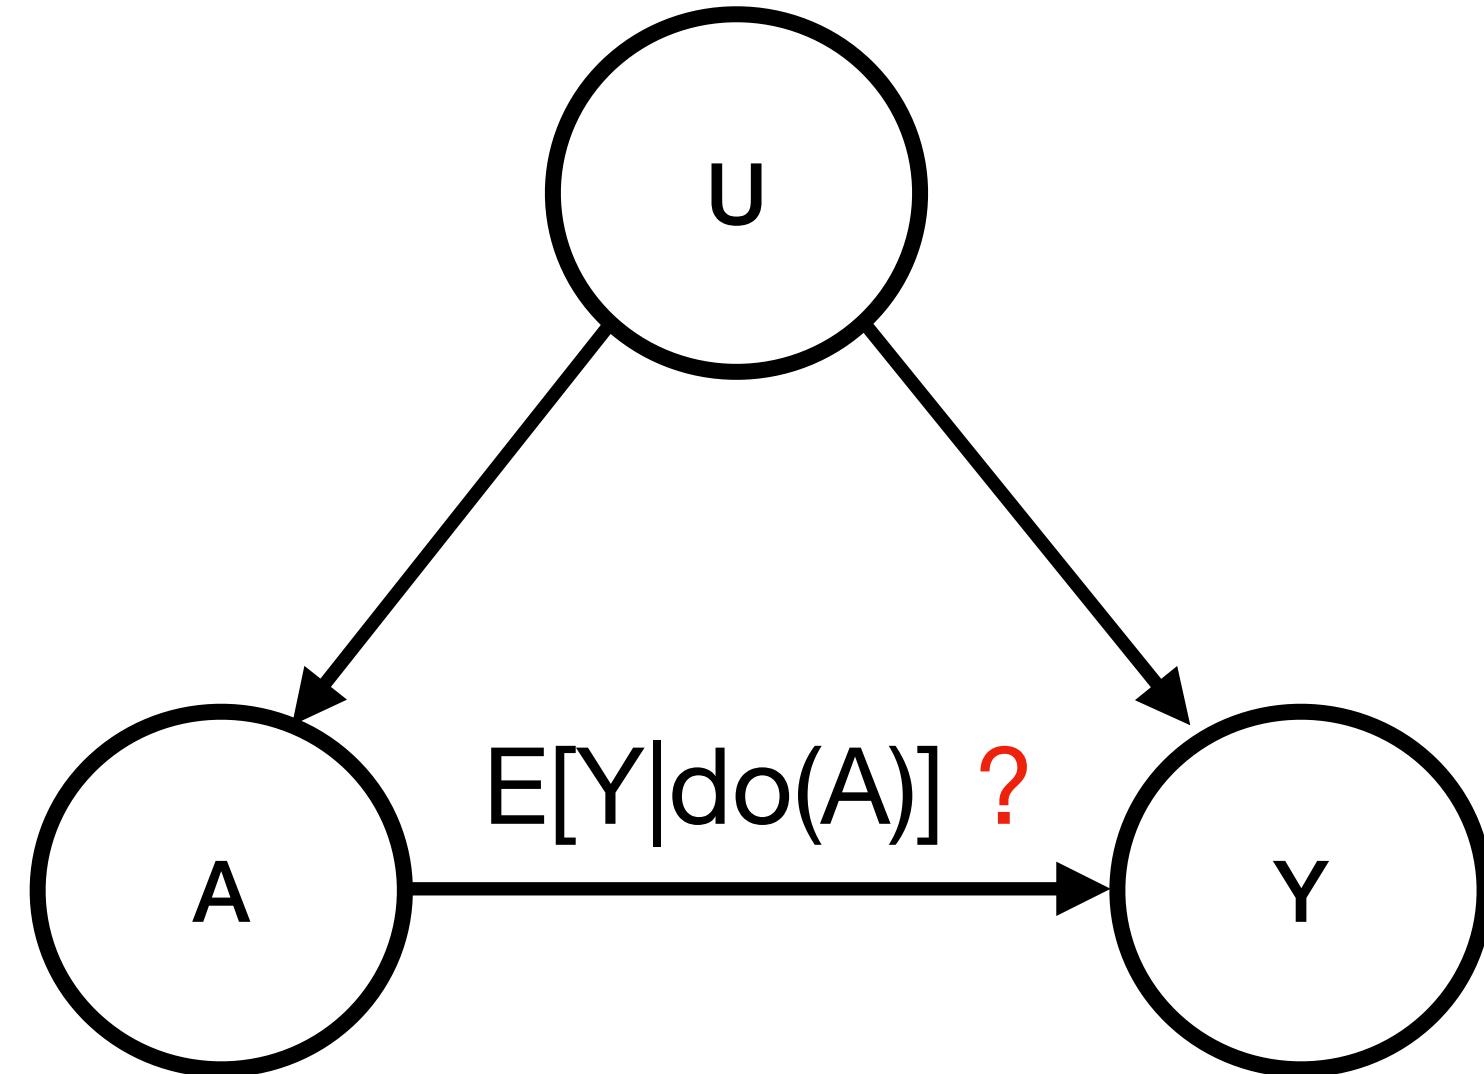

Excluded (A=a)

Observed data

Recap: Observed confounders

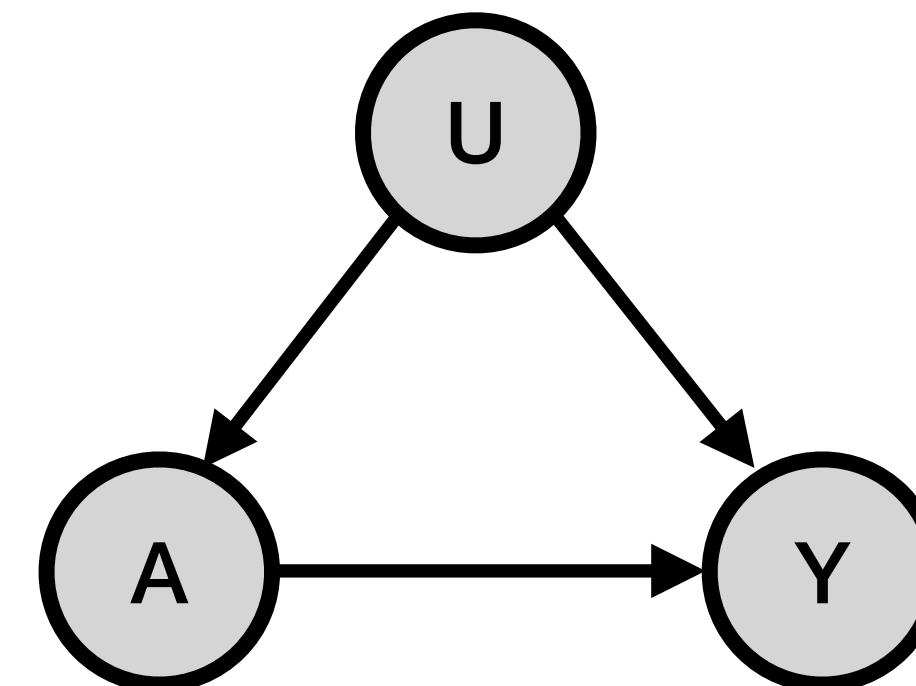

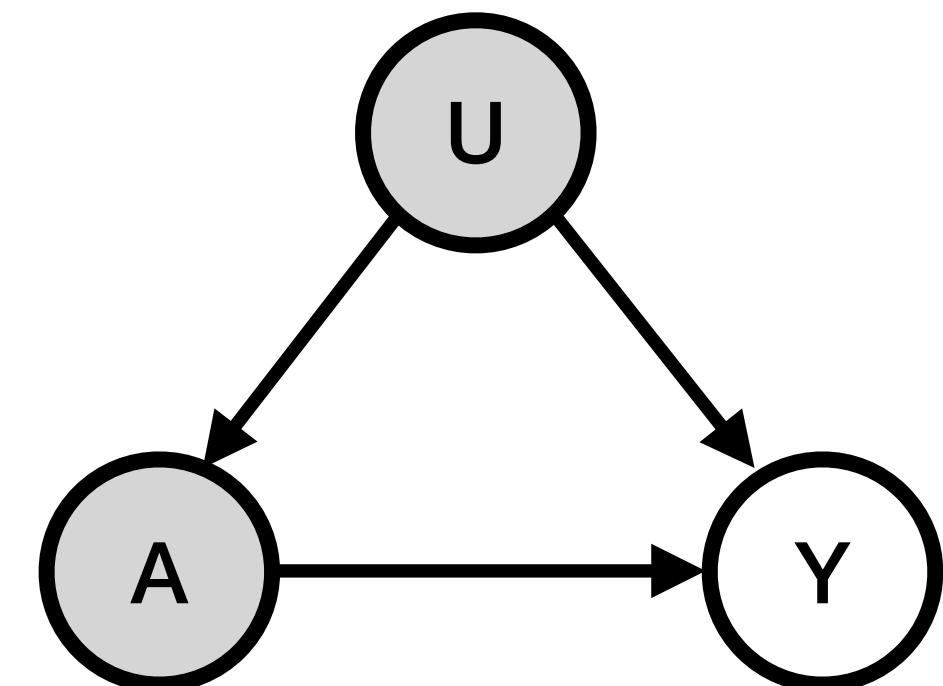

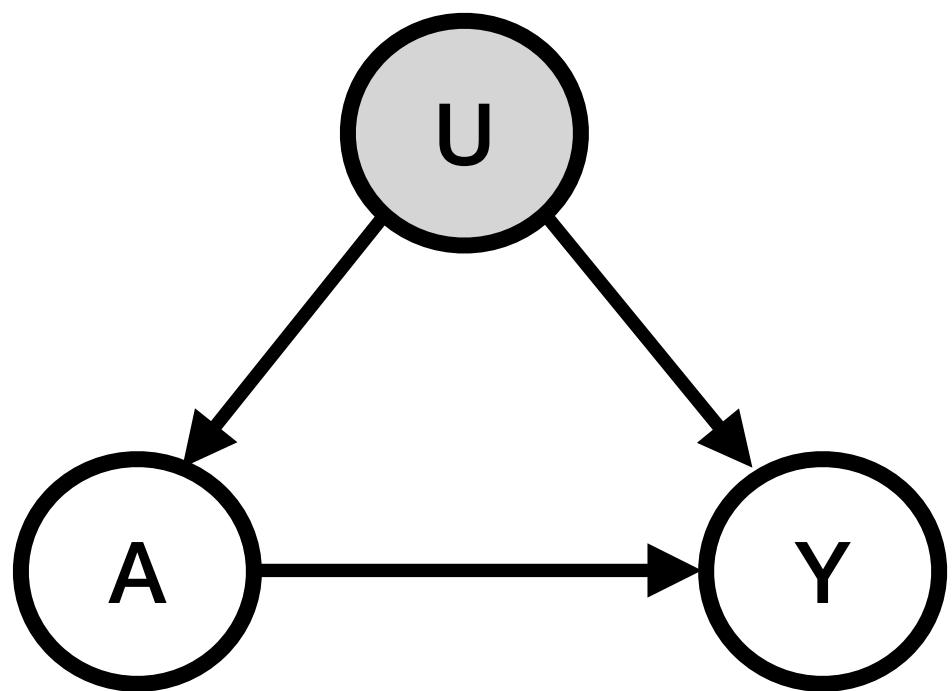

Backdoor adjustment: $\mathbb{E}[Y | do(a)] = \sum_{i=1}^n \mathbb{E}[Y | A = a, U = i] \mathbb{P}(U = i)$

What are the obstacles?

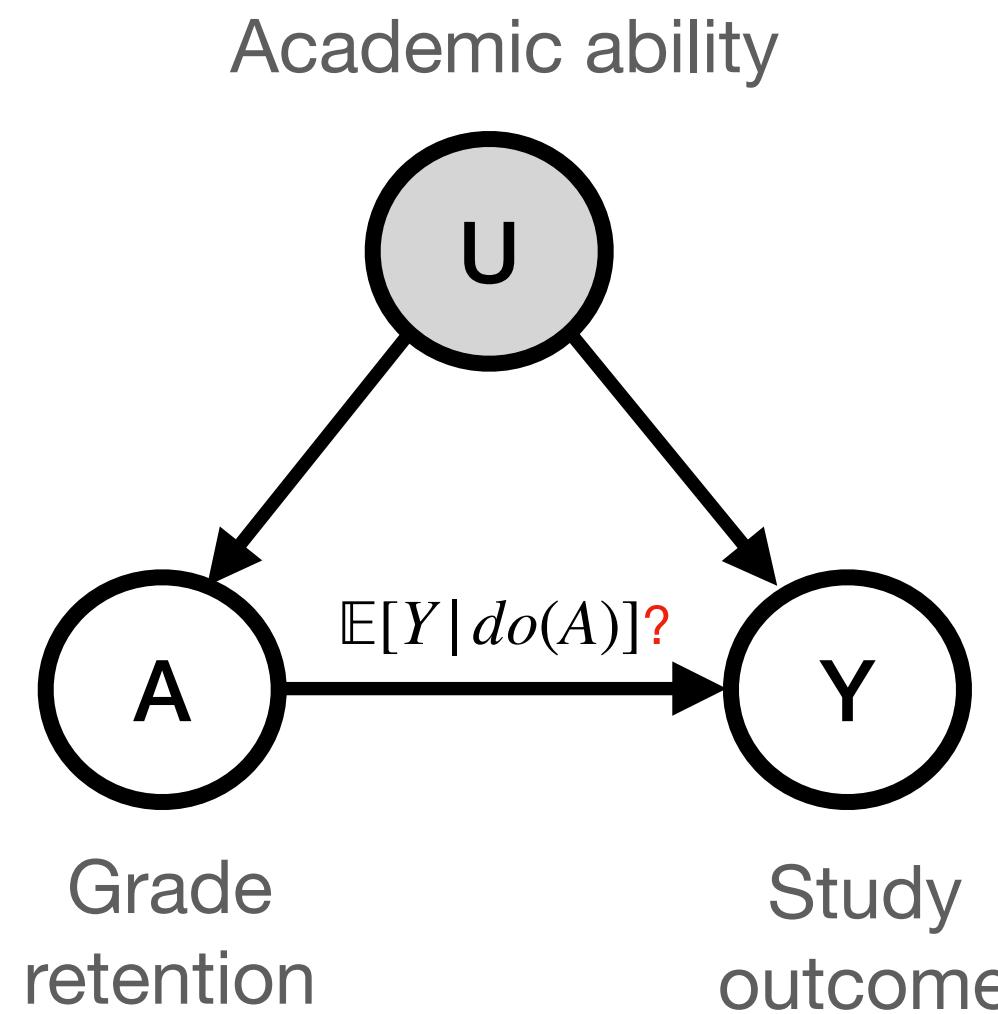

- Disentanglement issues from U.
 - e.g. U might lead to imbalanced datasets.
- Non-identifiability from latent variables.

<— More on this next

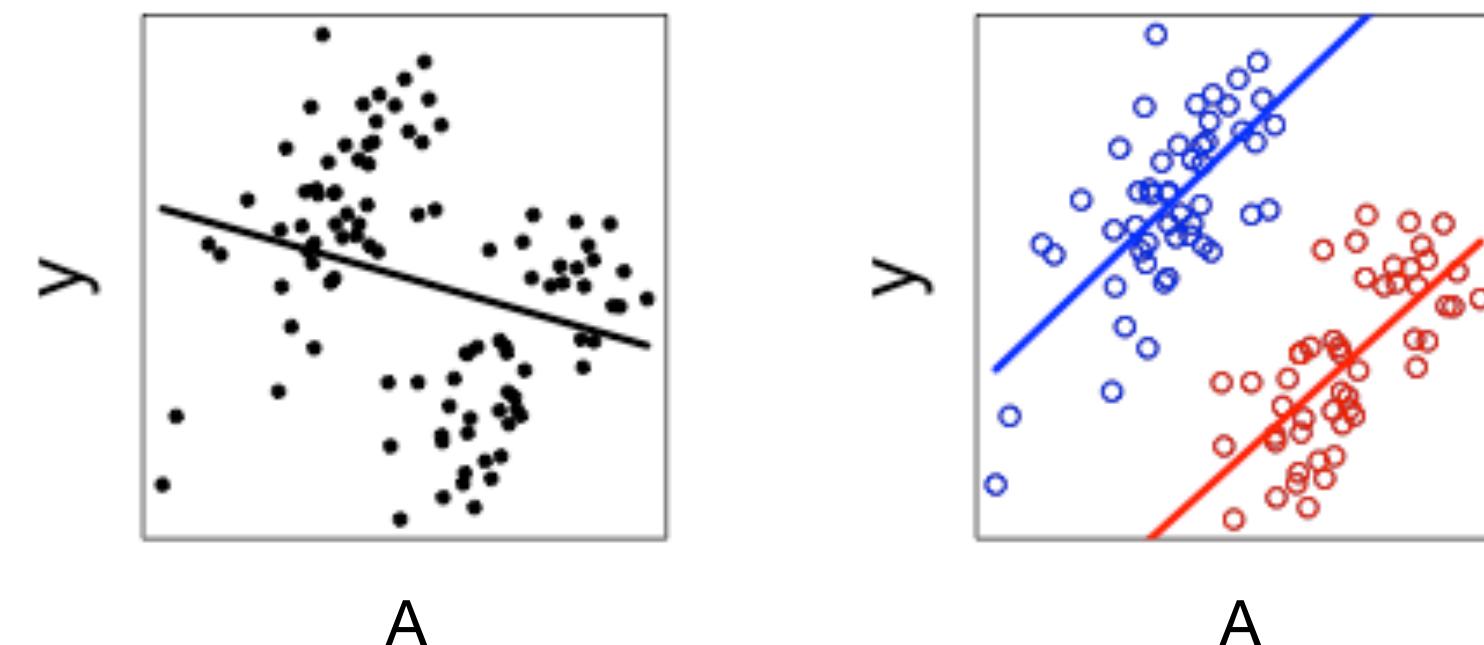

Why relax observability assumptions?

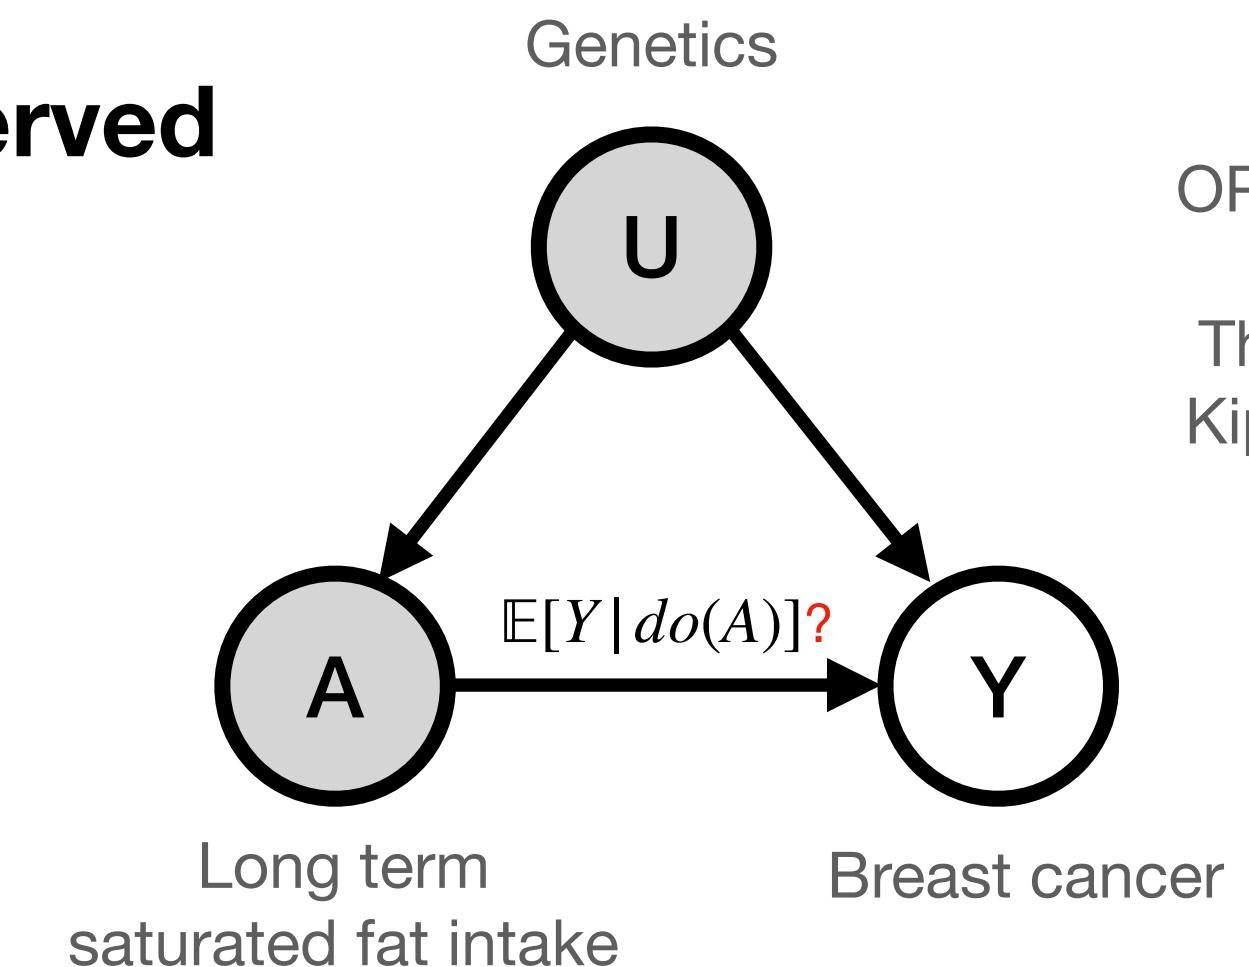

Unobserved confounders:

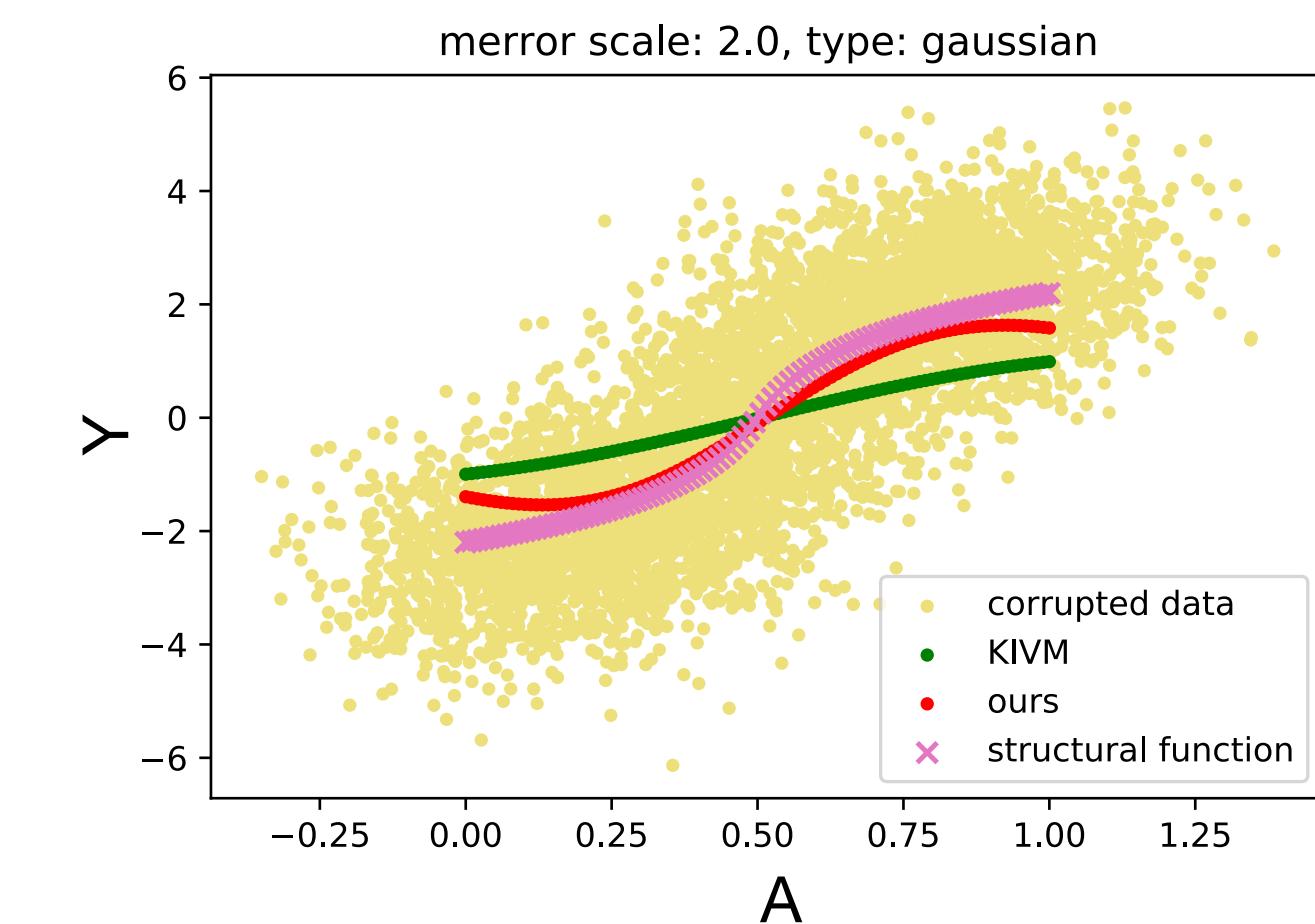

Simpson's paradox:

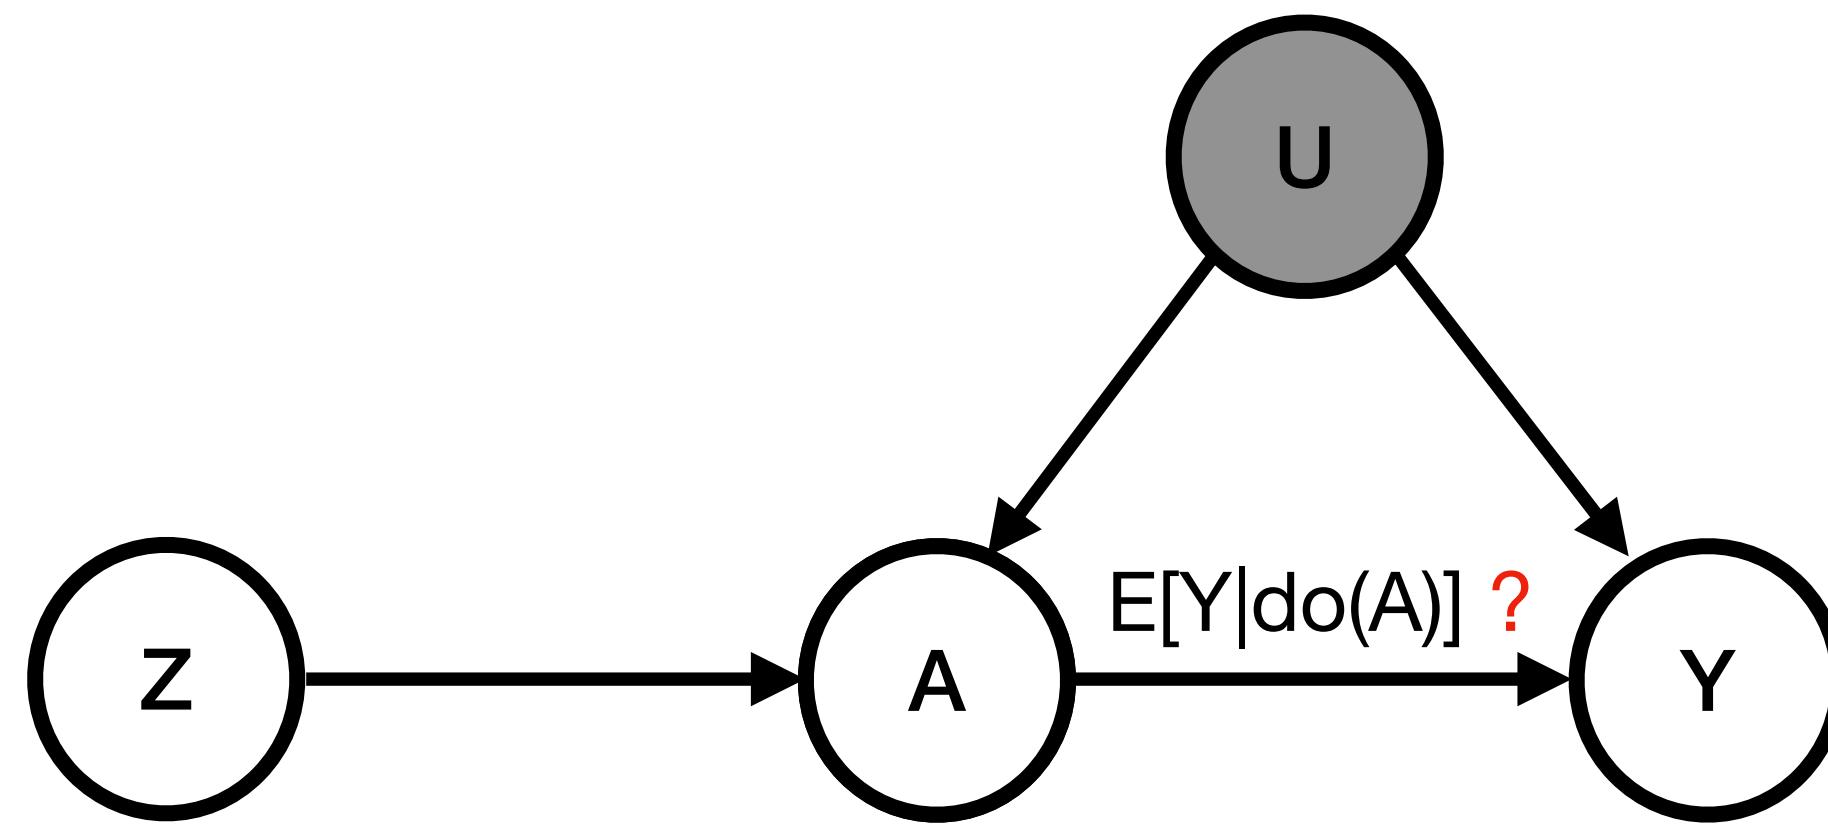

Action observed with error:

Mask interesting relationships:

Identification with instrumental variables

Identification:

$$Y = f(A) + \epsilon \quad \mathbb{E}[\epsilon | Z] = 0$$

$$f(A) = \mathbb{E}[Y | do(A)]$$

$$\mathbb{E}[Y | Z] = \int_{\mathcal{A}} f(a)p(a | Z)da$$

???

Linear case:

$$Y = \beta A + \epsilon_Y \quad \epsilon_Y \perp Z$$

$$A = \gamma Z + \epsilon_A \quad \epsilon_A \perp Z$$

$$\Rightarrow Y = \beta\gamma Z + \beta\epsilon_A + \epsilon_Y$$

(Strong) Assumptions:

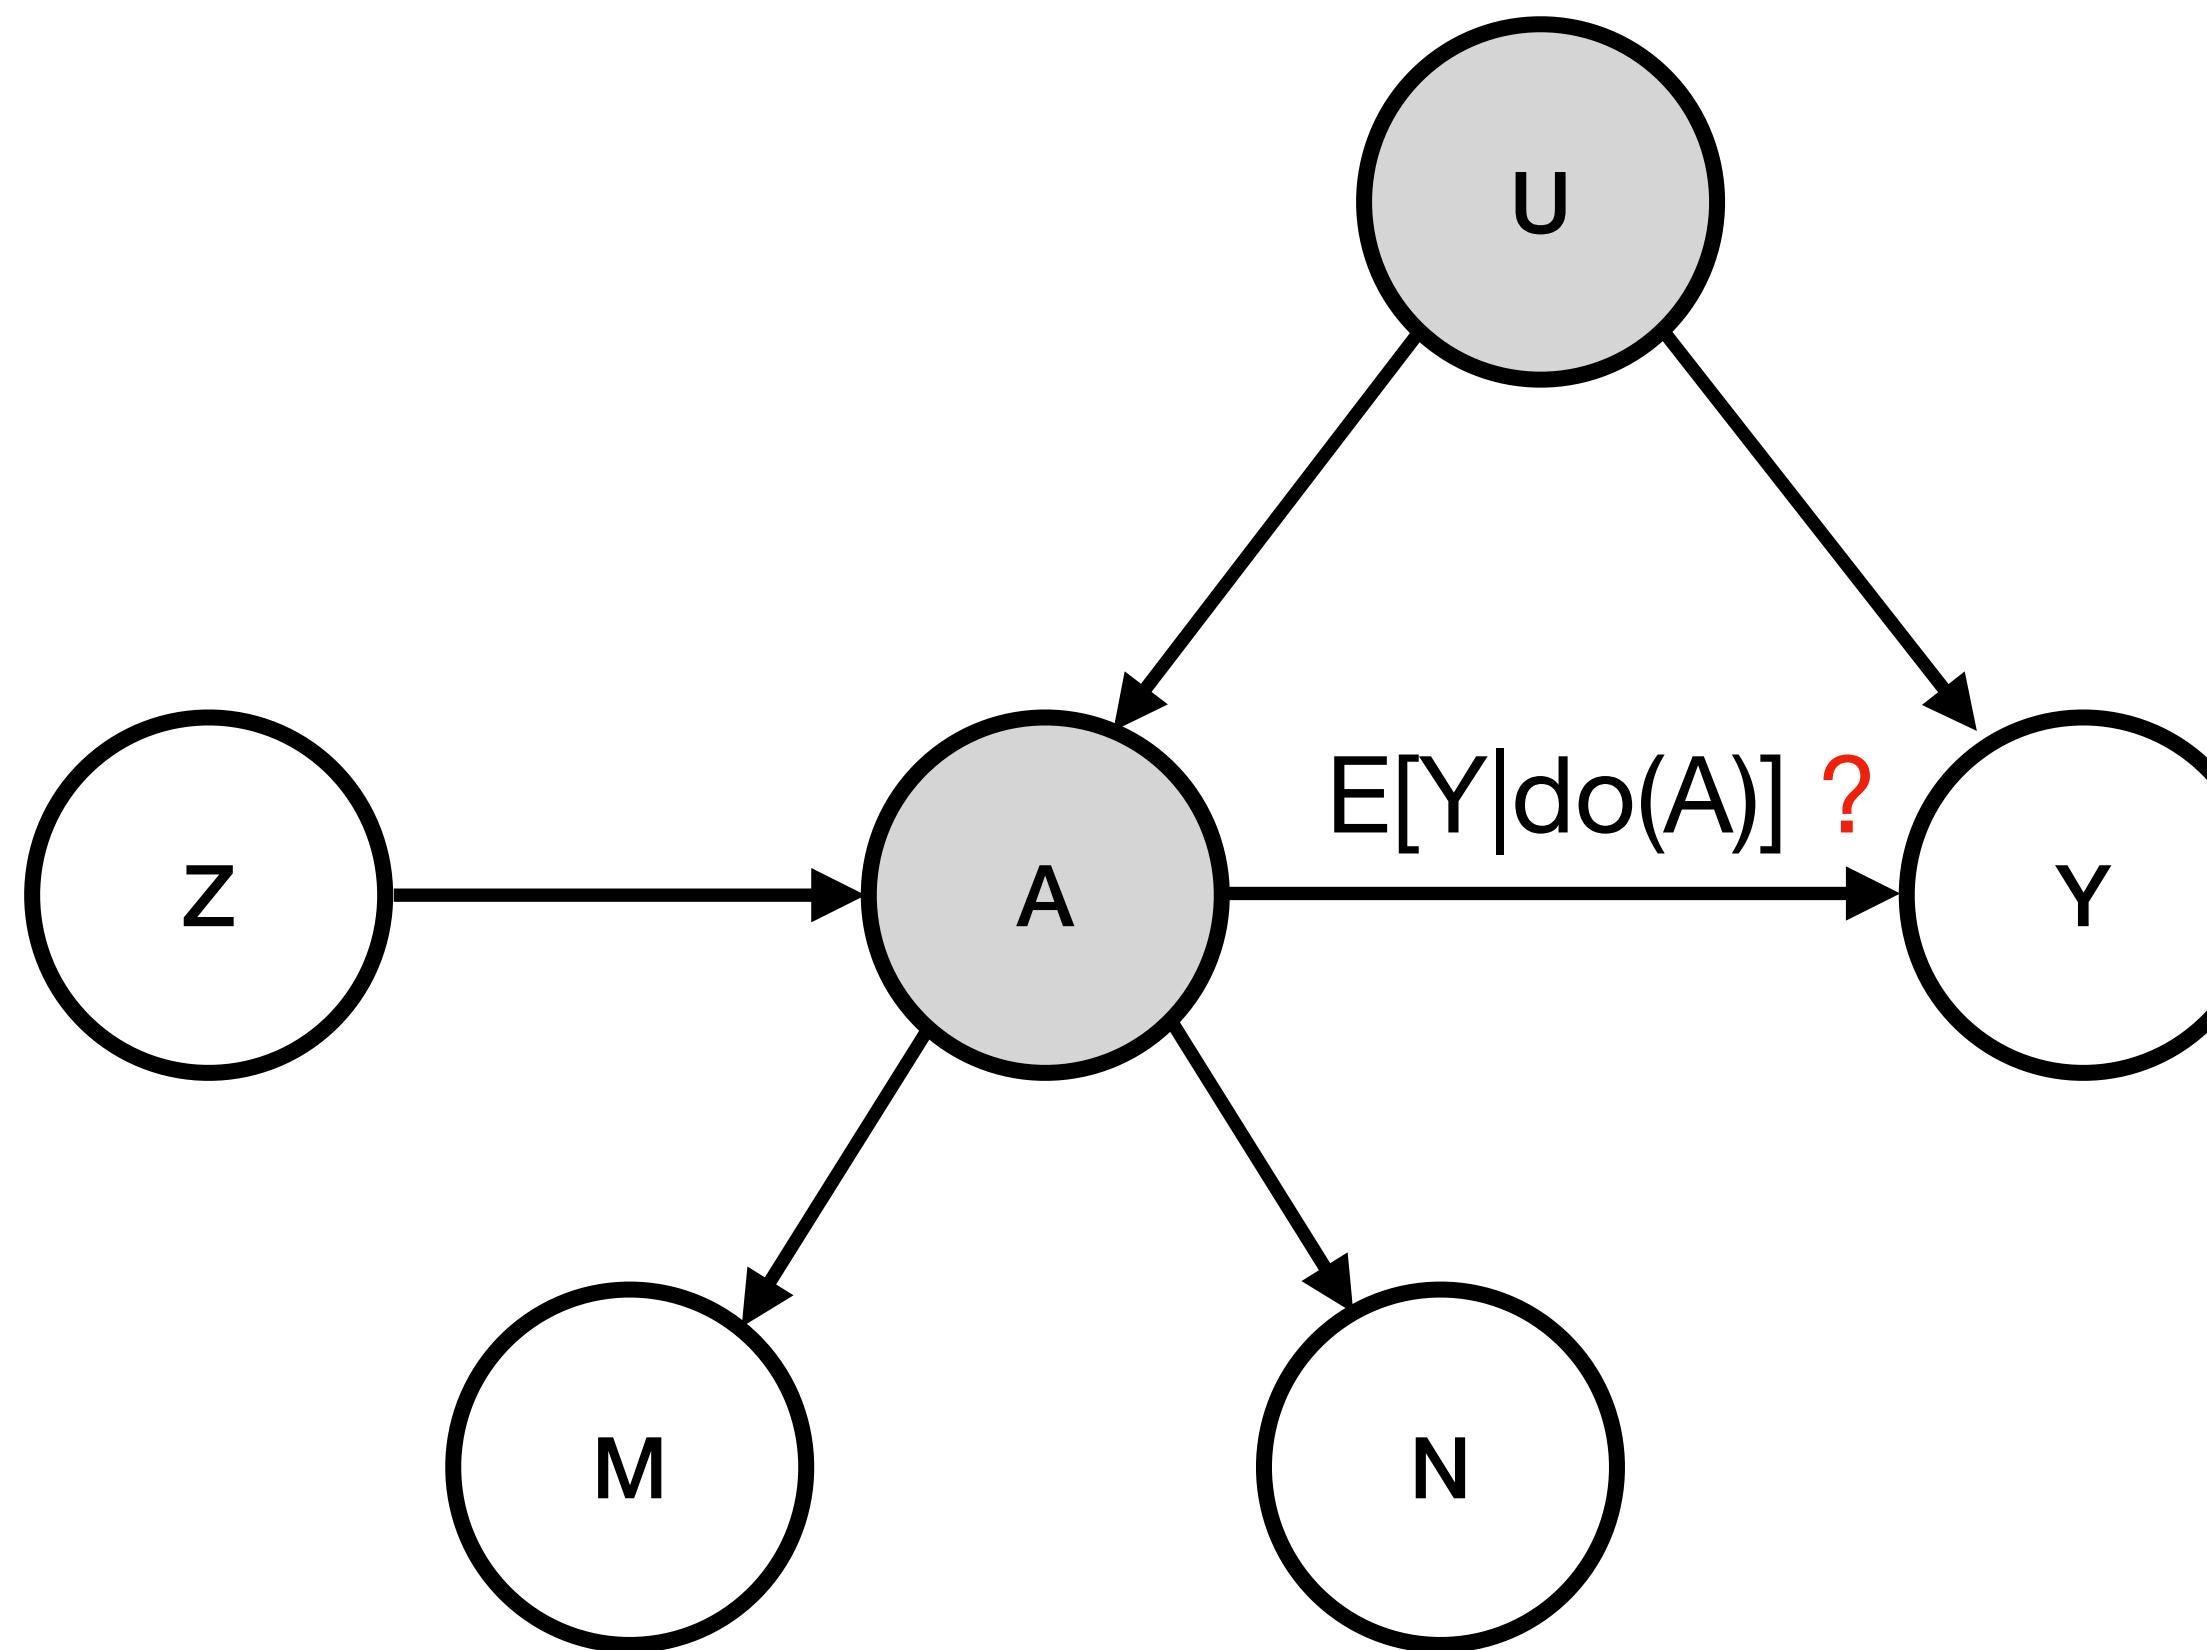

- Additive error model
- $(Z! \perp A)_G$
- $(Z \perp Y)_{G_{\bar{A}}}$

But if $f(a) = \theta^T \phi(a)$, then simplifies to

$$\mathbb{E}[Y | Z] = \theta^T \mathbb{E}[\phi(A) | Z]$$

False IV: using same 'IV' for several different actions.

Measurement error on action variables

Measurement error on action variables - overview

Measurement error assumptions

Additive noise on measurements:

$$M = A + \Delta M$$

$$N = A + \Delta N$$

Independence/uncorrelatedness:

$$\mathbb{E}[\Delta M | A, \Delta N] = 0$$

$$\Delta N \perp A$$

Instrumental identification assumptions

Additive noise on nonlinear response:

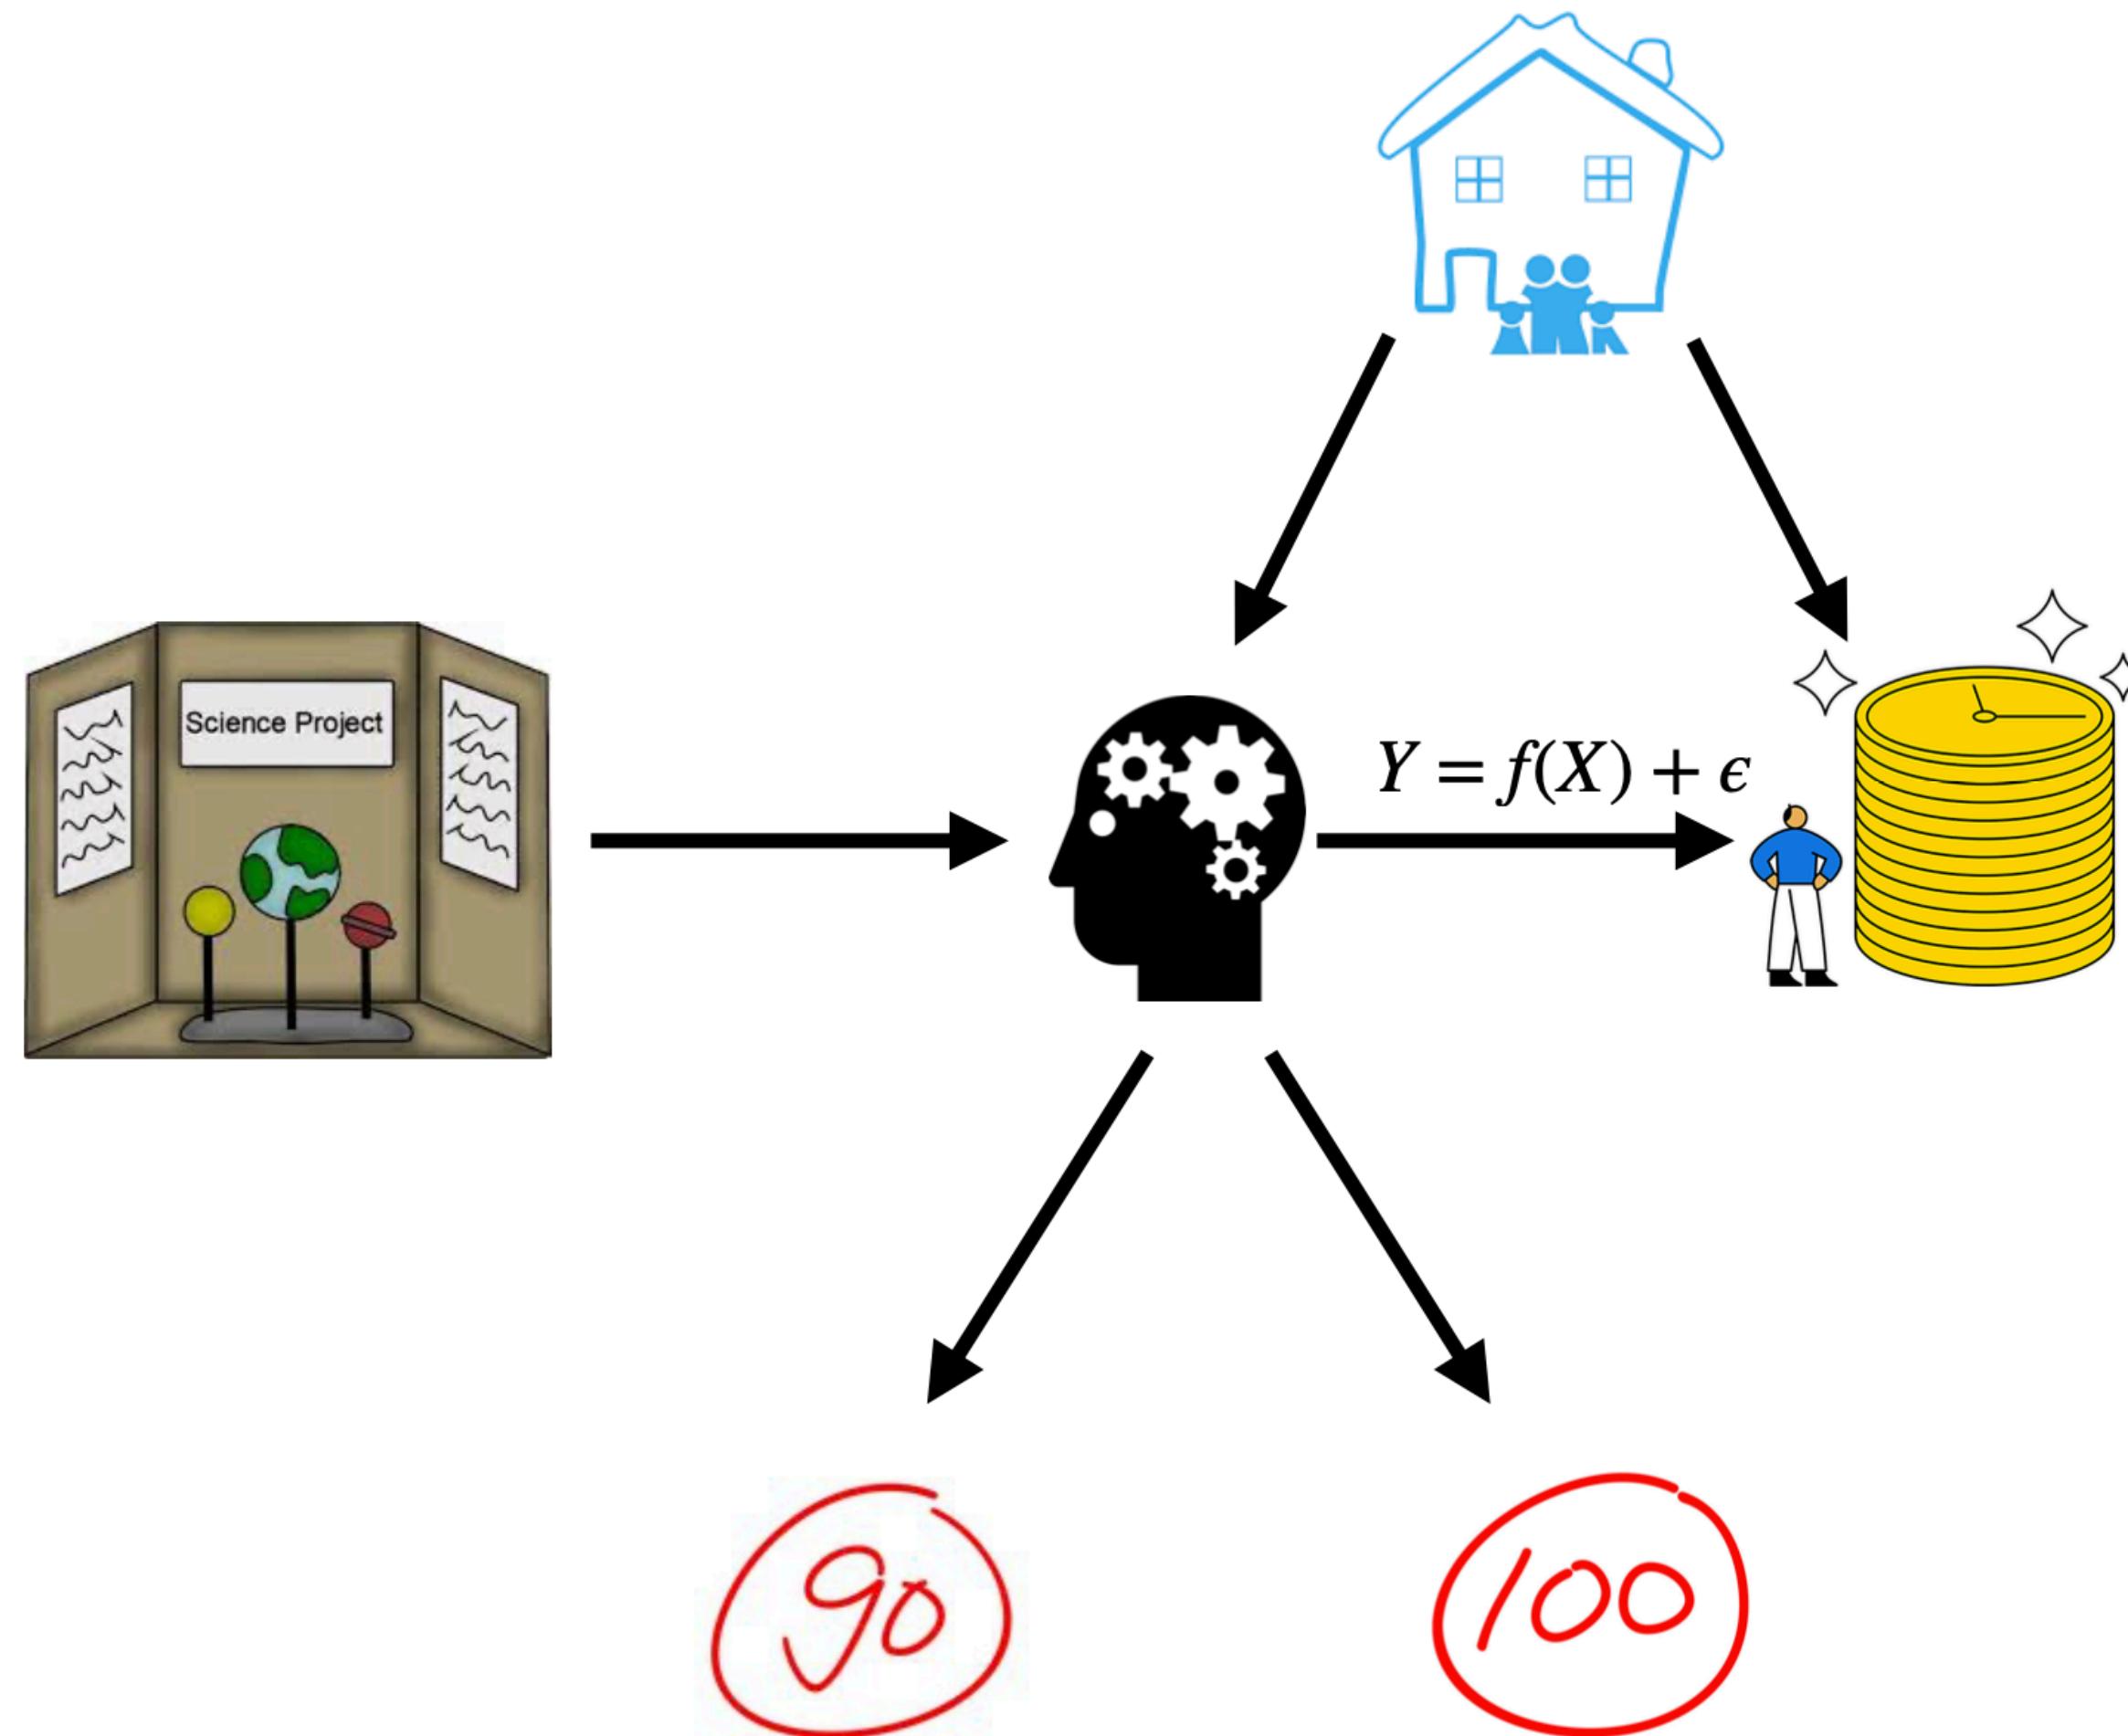

$$Y = f(A) + \epsilon \quad \mathbb{E}[\epsilon | Z]$$

IV structural assumptions:

$$(Z! \perp A)_G$$

$$(Z \perp Y)_{G_{\bar{A}}}$$

Application scenario

Measurement error on action variables - overview

Additive noise:

$$M = A + \Delta M$$

$$N = A + \Delta N$$

Independence/uncorrelatedness:

$$\mathbb{E}[\Delta M | A, \Delta N] = 0$$

$$\Delta N \perp A$$

Kotlarski's:

$$\frac{\psi_{A|z}(\alpha)}{\mathbb{E}[e^{iaA} | z]} = \exp\left(\int_0^\alpha i \frac{\mathbb{E}[Me^{i\nu N} | z]}{\mathbb{E}[e^{i\nu N} | z]} d\nu\right) \quad (1)$$

Parametric assumption:

- Use $\psi_{A|Z}$ to get expectations of basis functions by:
- Convolve FT of basis function and characteristic function.

Can we do better? **Yes!**

From $\hat{\psi}_{A|z}^n(\alpha)$ to $\hat{\mu}_{A|z}^n(y)$

$$\frac{\psi_{A|z}(\alpha)}{\mathbb{E}_{\mathcal{P}_{A|z}}[e^{i\alpha X}](\alpha)} = \exp\left(\int_0^\alpha i \frac{\mathbb{E}[Me^{i\nu N}|z]}{\mathbb{E}[e^{i\nu N}|z]} d\nu\right) \quad (1)$$

Have $\hat{\mu}_{A|z}^n(y) = \sum_{j=1}^n \hat{\gamma}_j^n(z) k(a_j, y)$.

Let $\hat{\psi}_{A|z}^n(\alpha) := \sum_{j=1}^n \hat{\gamma}_j^n(z) e^{i\alpha a_j}$.

Where $\hat{\gamma}_j^n(z) = (K_{ZZ} + n\hat{\lambda}^n I)^{-1} K_{Zz}$.

Theorem 1. With translation-invariant, characteristic kernel:
 $\hat{\mu}_{A|Z}^n \xrightarrow{n} \mu_{A|Z}$ iff $\hat{\psi}_{A|Z}^n \xrightarrow{n} \psi_{A|Z}$ in IFT of kernel.

Assume $f \in \mathcal{H}_A$:

$$\mathbb{E}[Y|Z] = \mathbb{E}[f(A)|Z] = \langle f, \mu_{A|Z} \rangle_{\mathcal{H}_A}$$

How to get $\mu_{A|Z}$?

Approximate $\hat{\mu}_{A|Z}^n$ via $\hat{\psi}_{A|z}^n$ (eq.1):

Both only depend on $\hat{\gamma}_j^n(z)$ and $\{a_j\}_{j=1}^n$!

Measurement Error KIV

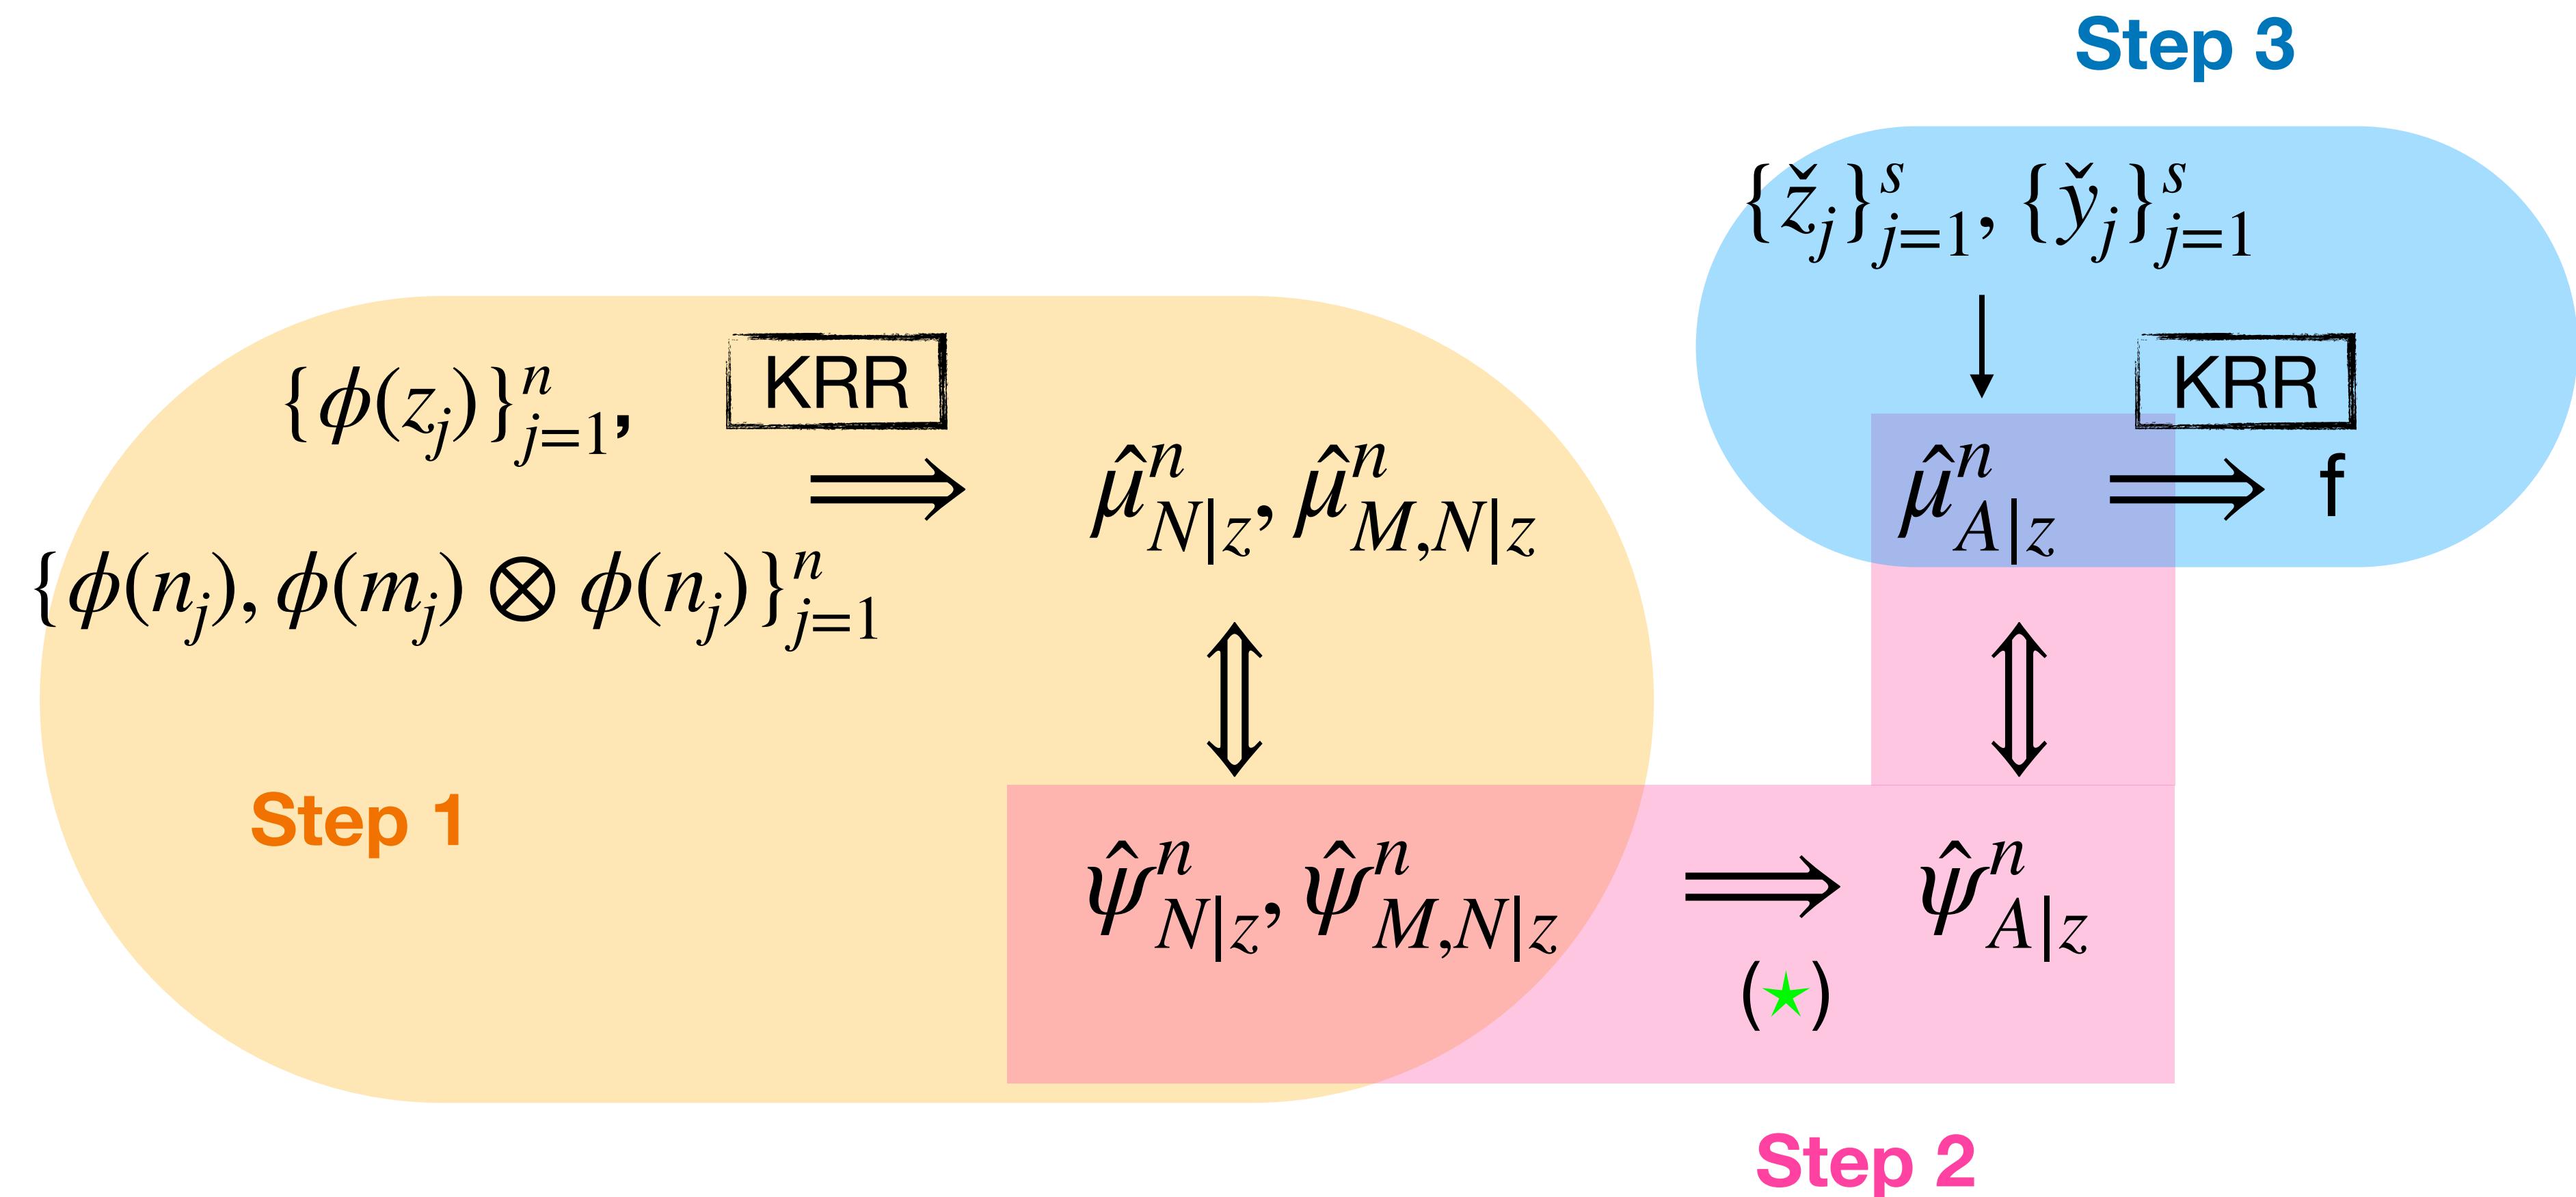

To obtain $\hat{\psi}_{A|z}^n$:

$$\frac{\psi_{A|z}(\alpha)}{\mathbb{E}_{\mathcal{P}_{A|z}}[e^{i\alpha X}](\alpha)} = \exp \left(\int_0^\alpha i \frac{\frac{\partial}{\partial v} \psi_{M,N|z}(v, \nu) \Big|_{v=0}}{\underbrace{\mathbb{E}[Me^{i\nu N}|z]}_{\psi_{N|z}(\nu)}} d\nu \right) \quad (1)$$

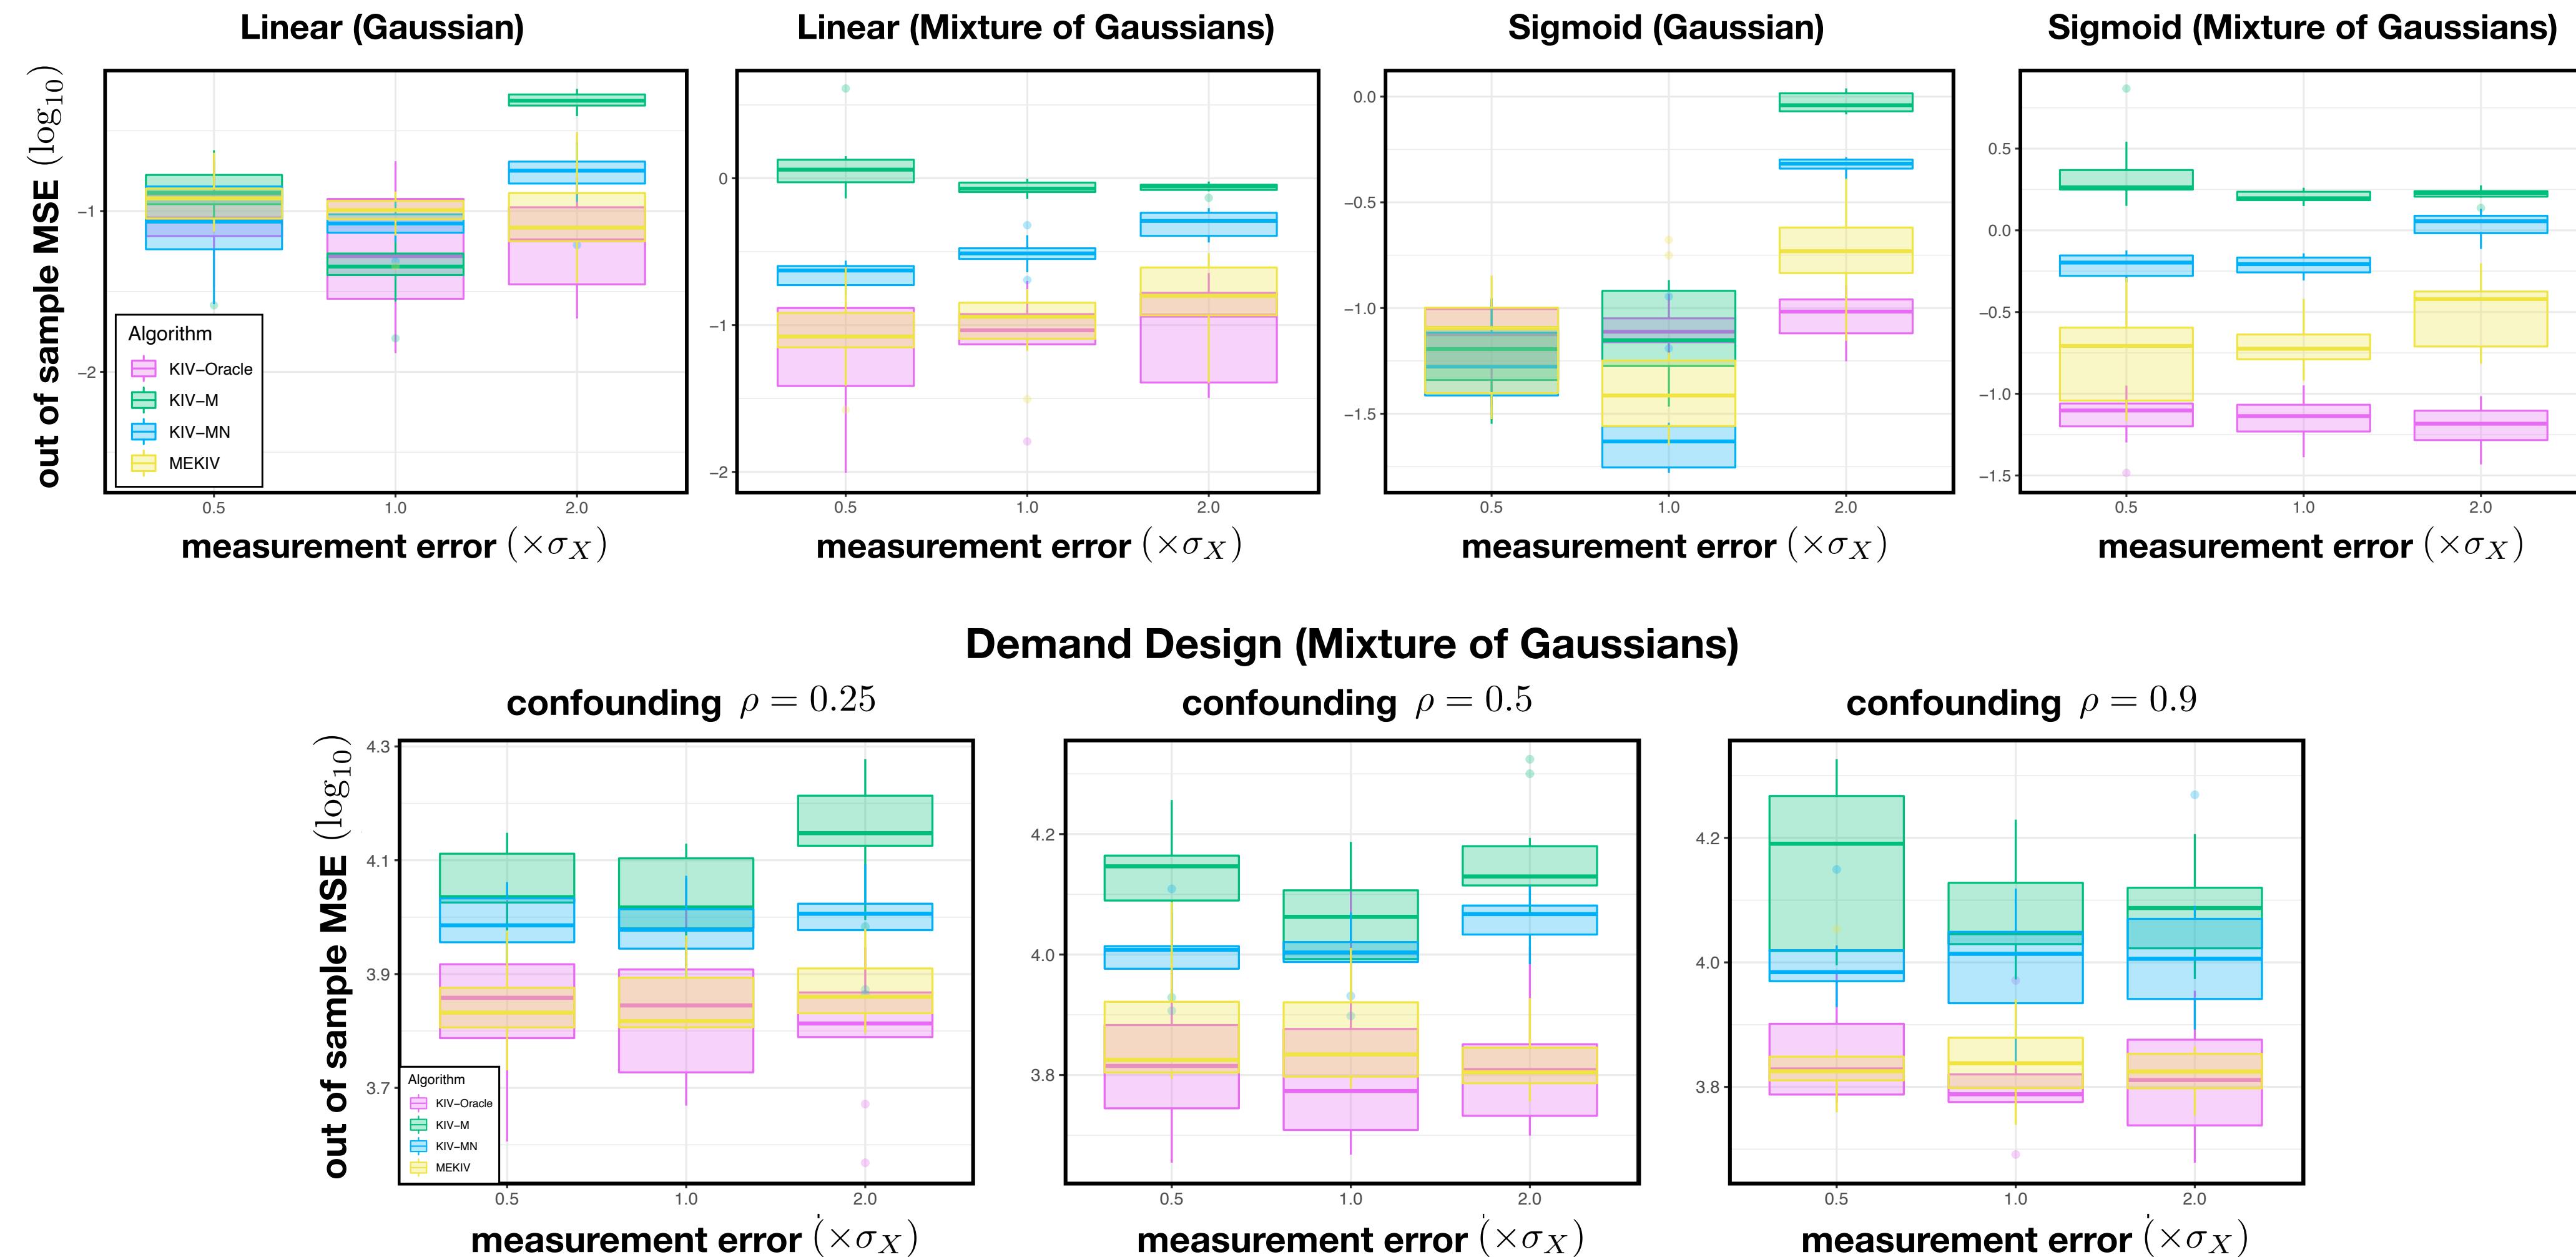

1. Differentiate wrt α to remove integral.
2. Replace with sample estimates.

$$\frac{\frac{d}{d\alpha} \hat{\psi}_{A|z}^n(\alpha)}{\hat{\psi}_{A|z}^n(\alpha)} = \frac{\frac{\partial}{\partial v} \hat{\psi}_{M,N|z}^n(v, \alpha) \Big|_{v=0}}{\hat{\psi}_{N|z}^n(\alpha)} \quad (2)$$

Measurement Error KIV

MEKIV results

Future directions

- Relax the additive error assumption.
- Extend to sequential settings.

Thanks for listening! :)
